3) Assign also new age <-c(age ,0,age). What happen to the new_age?

Compared to the object “age”, in “new_age” a number “0” Is added after the values of the “age” and repeated the values of the “age” again.

```

9) Print a vector with the integers between 1 and 100 that are not divisible by 3, 5 and 7 using filter option. filter(function(i) { all(i %% c(3,5,7) != 0) }, seq(100)) Write the R code and its output.

object is not a matrix

(if the letter “f” in filter is in small letter the result would end up in error)

[17] 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32

```

11) List all the natural numbers below 25 that are multiples of 3 or 5.

```
multiple_by3 <- c(3,6,9,12,15,18,21,24)
```

```
> multiple_by5 <- c(5,10,15,20)
```

```
> sum(multiple_by3)
```

```
[1] 108
```

```
> sum(multiple_by5)
```

```
[1] 50
```

```
> sum(multiple_by3, multiple_by5)
```

```
[1] 158
```

Find the sum of these multiples.

a. How many data points from 10 to 11? **101 data points**

b. Write the R code and its output from 10 and 11.

#10

```
> seq(100:1)

[1] 1 2 3 4 5 6 7 8 9 10 11
12 13 14 15 16

[17] 17 18 19 20 21 22 23 24 25
26 27 28 29 30 31 32

[33] 33 34 35 36 37 38 39 40 41
42 43 44 45 46 47 48

[49] 49 50 51 52 53 54 55 56 57
58 59 60 61 62 63 64

[65] 65 66 67 68 69 70 71 72 73
74 75 76 77 78 79 80

[81] 81 82 83 84 85 86 87 88 89
90 91 92 93 94 95 96

[97] 97 98 99 100
```

```
#11
```

```
> multiple_by3 <-
c(3,6,9,12,15,18,21,24)

> multiple_by5 <- c(5,10,15,20)

> sum(multiple_by3)

[1] 108

> sum(multiple_by5)

[1] 50

> sum(multiple_by3, multiple_by5)

[1] 158
```

12) Statements can be grouped together using braces '{' and '}'. A group of statements is sometimes called a **block**. Single statements are evaluated when a new line is typed at the end of the syntactically complete statement. Blocks are not evaluated until a new line is entered after the closing brace. Enter this statement { x <- 0+ x + 5 + }

Describe the output.

```
{ x <- 0+ x + 5 + } Error: unexpected '}' in "{ x <- 0+ x + 5 + }"
```

(due to the use of the closing braces is the error in the statement)

13) Set up a vector named `score`, consisting of 72, 86, 92, 63, 88, 89, 91, 92, 75, 75 and 77. To access individual elements of an atomic vector, one generally uses the `x[i]` construction.

Find `x[2]` and `x[3]`. Write the R code and its output.

```
score <- c(72, 86, 92, 63, 88, 89, 91, 92, 75, 75, 77)
```

```
> score[2]
```

```
[1] 86
```

```
> score[3]
```

```
[1] 92
```

14) Create a vector `a = c(1,2,NA,4,NA,6,7)`.

a. Change the NA to 999 using the codes `print(a,na.print="-999")`.

```
a = c(1,2,NA,4,NA,6,7)
```

```
> print(a,na.print="-999")
```

```
[1] 1 2 -999 4 -999 6 7
```

b. Write the R code and its output. Describe the output.

```
a = c(1,2,NA,4,NA,6,7)
```

```
> print(a,na.print="-999")
```

```
[1] 1 2 -999 4 -999 6 7
```

(the first output statement “NA” was replaced by “-999”)

2. 15) A special type of function calls can appear on the left hand side of the assignment operator as in `> class(x)`

```
<- "foo".
```

Follow the codes below:

```
name = readline(prompt="Input your name: ") age = readline(prompt="Input your age: ")  
print(paste("My name is",name, "and I am",age, "years old. ")) print(R.version.string)
```

What is the output of the above code?

```
[1] "My name is Bryce Kendric Saladar and I am 19 years old."
```

```
> print(R.version.string)
```

```
[1] "R version 4.2.1 (2022-06-23 ucrt)"
```
